

Poseida Therapeutics and TScan Therapeutics Announce Research Collaboration and License Agreement to Explore Developing Allogeneic T Cell Receptor Therapies for the Treatment of COVID-19

October 21, 2020

Partnership Leverages TScan's Proprietary High-throughput TCR/Target Discovery Platform and Poseida's Proprietary Allogeneic T Cell Approach to Advance Potential TCR-T Treatments

SAN DIEGO and WALTHAM, Mass., Oct. 21, 2020 /PRNewswire/ -- Poseida Therapeutics, Inc. (NASDAQ:PSTX), a clinical-stage biopharmaceutical company utilizing proprietary gene engineering platform technologies to create cell and gene therapeutics with the capacity to cure, and TScan Therapeutics, Inc., a biopharmaceutical company focused on the development of T cell receptor (TCR)-engineered T cell therapies in oncology, today announced a research collaboration and license agreement to explore developing TCR-T cell therapies for the treatment of COVID-19. Poseida's allogeneic T cell platform will be used in combination with TScan's discovered immunodominant epitopes and TCR sequences for the development and commercialization of allogeneic TCR-T cell therapies.

"The TScan relationship will allow us to expand our platform and T cell experience, utilizing one or more TCRs in allogeneic cell therapy applications," said Devon Shedlock, Ph.D., Senior Vice President of Research and Development for Poseida. "We are impressed by TScan's novel platform for the discovery of TCRs. This, coupled with the opportunity to explore our allogeneic T cell platform's potential for also treating diseases outside of oncology, including COVID-19 and eventually other infectious diseases, represents an exciting and differentiated approach."

"Therapeutic strategies to treat COVID-19 have largely focused on neutralizing antibodies that block viral infection or small molecule drugs that inhibit viral replication," said Gavin MacBeath, Ph.D., Chief Scientific Officer at TScan. "We are excited about the possibility of combining our SARS-CoV-2 TCR findings with Poseida's allogeneic T Cell approach to explore a potential cellular therapy for patients with COVID-19. We look forward to collaborating with the Poseida team on this approach."

Emerging studies suggest that patients who fail to mount effective T cell responses often end up with more severe and life-threatening disease. Administering virus-specific engineered T cells may provide a rapid and effective way to address this deficiency. Results from TScan demonstrate that generating a memory T cell response targeting specific proteins may be important for fighting the virus and for long-term immunity. Combining these findings with Poseida's off-the-shelf allogeneic T cell product approach, which has generated a very high percentage of stem cell memory T cells (Tscm) and has the potential to yield hundreds of doses from a single manufacturing run using proprietary booster molecule technology, may provide both an immediate therapeutic effect, as well as longer-term immunity.

TScan recently announced data generated by their TCR/Target Discovery platform identifying the precise targets of T cells isolated from COVID-19 convalescent patients, along with the TCRs that recognize them. A core set of targets were shared among patients with the same human leukocyte antigen (HLA) type and were primarily located outside the spike protein. A paper describing this work is currently in press at *Immunity*, a Cell Press journal. TScan worked with clinical partner Atlantic Health Systems to recruit recovering COVID-19 patients for this work. Combining these findings with Poseida's off-the-shelf allogeneic T cell product platform may provide an accessible cell-based therapy for patients with insufficient T cell responses.

Under the terms of the Agreement, Poseida will gain access to TScan's data and IP related to TCR sequences and targets potentially valuable in treating COVID-19, and TScan will provide TCR expertise and counsel to the research collaboration. Detailed financial terms of the collaboration were not disclosed.

About Poseida Therapeutics, Inc.

Poseida Therapeutics is a clinical-stage biopharmaceutical company dedicated to utilizing our proprietary gene engineering platform technologies to create next generation cell and gene therapeutics with the capacity to cure. We have discovered and are developing a broad portfolio of product candidates in a variety of indications based on our core proprietary platforms, including our non-viral piggyBac® DNA Modification System, Cas-CLOVER™ site-specific gene editing system and nanoparticle- and AAV-based gene delivery technologies. Our core platform technologies have utility, either alone or in combination, across many cell and gene therapeutic modalities and enable us to engineer our wholly-owned portfolio of product candidates that are designed to overcome the primary limitations of current generation cell and gene therapeutics.

About TScan Therapeutics

TScan discovers and develops transformative T cell therapies (TCR-T) to treat liquid cancers, solid tumors, and other serious diseases. Our proprietary, high-throughput platform identifies previously uncharacterized, clinically-derived shared T cell antigens and all off-target TCR interactions, to enable the development of highly efficacious TCR-Ts with minimal off-target effects. Lead program TSC-100 is expected to enter clinical

development for liquid cancers in 2021, and the Company is advancing additional TCR-Ts for solid cancers. TScan was co-founded by Chair Christoph Westphal (Partner, Longwood Fund) based on pioneering research from the Elledge Lab at Brigham and Women's Hospital. The Company has raised over \$80 million to date from leading strategic collaborators and investors including Longwood Fund, Novartis Institutes for Biomedical Research, Astellas Venture Management, Novartis Venture Fund, Bessemer Venture Partners, GV, 6 Dimensions Capital, and Pitango Venture Capital.
